AMD DEVELOPER HACKATHON ACT III · HEALTH AND WELLBEING

As Prescribed

The home program, exactly as the therapist prescribed it. Verified line by line, in the patient's own language.

Runs on the clinic's own AMD Radeon cards · try it on AMD Radeon Cloud

Supported

Single-leg bridge (right). 3 × 10, every day.

Prescribed by the therapist: s012, s013

Conflict: the therapist decides

Single-leg stance on the prosthesis, at home.

Documented restriction: supervised sessions only

Proposal: not prescribed as stated

An exercise named without side or dose.

Shown to the therapist only

A home program the patient cannot read

Language

The patient leaves the visit with instructions they cannot read, or a translation nobody in the room can check.

Safety

A wrong side, a wrong dose or a dropped caution can hurt the patient at home, alone.

Free-writing AI

It makes things worse: it adds plausible exercises nobody prescribed.

For the physiotherapist, who prescribes and approves, and the patient, who goes home with the program. Arabic and Ukrainian in the demo.

It verifies the therapist's prescription. It never prescribes.

No diagnosis, no judgement of suitability, no advice of its own. Suitability stays the therapist's clinical judgement: the product makes that judgement visible instead of replacing it.

Every line has exactly one state

Supported

A transcript span says it and no documented restriction blocks it. Linked to that span.

Conflict: the therapist decides

A documented restriction blocks it. The program halts until the therapist decides.

Proposal

Nothing in the session says it as stated. Only the therapist sees it.

Uncertain translation

The back-translation disagrees with the prescribed item. Flagged for the therapist.

Nothing reaches the patient until the therapist approves every line.

Safety does not rest on a model

Solid teal: decided by code. Dashed: a model. Dark: a person.

Restrictions are rules

A fired restriction stays a conflict whatever a model does afterwards.

The English line is composed

From the item and an approved catalogue sentence; a correction may never change the exercise.

A different family checks

The falsifier checks each line against the transcript and back-translates it, in rounds.

Built for the clinic’s own AMD Radeon cards

Real patient data does not leave the clinic.

So the product runs on the clinic’s own hardware. Even the cloud API the event provides forbids health data in its terms, and keeps prompts for about two days.

AMD Radeon AI PRO R9700

Qwen3.5-35B-A3B drafts and translates · about 66 tok/s

AMD Radeon RX 7900 XT

Gemma 3 12B checks every line · about 55 tok/s

40–44 s

program ready after the visit

304 Wh

the whole evaluation, 74.5 min

ROCm

two llama.cpp servers

Measured on the Somnus box, 14 Oct 2026 · ready time: the slowest session in each evaluation run

Try the same pipeline on AMD Radeon Cloud

The public demo runs each case live on Token Factory: Qwen3.8-27B drafts, Gemma-4-31B-IT checks.

After each run the page says whether the same case gave the same line states on the clinic hardware, and for an injected error whether both caught it.

When the shared cloud is too busy to finish within 90 s, the page shows the clinic run instead and says so.

6 / 6

clean demo cases gave the same line states in the cloud and on the clinic’s Radeon cards

Trial on 14 Oct 2026 · 53–85 s after the visit

asprescribed.sunrisesoftware.app

Measured, and reported as it fell

32 injected errors of six types and 9 clean runs, in a plan sealed by its sha256 before the first run. Detection is read before any correction.

Measure	Run 1, pre-registered	Run 2, after fixes	Threshold
Recall, all 32 errors	0.59, below	0.72, below	0.80
Recall, the 18 only a model can catch	0.28, below	0.50, below	0.60
Recall, the 14 the rules and checks catch	1.00	1.00	none
False alarms on clean lines	16.2 %, above	6.9 %, met	15 %
Ready after the visit, slowest session	40 s, met	44 s, met	90 s

The recall gate failed in both runs. Every documented restriction was caught.

Local mode on the Radeon cards · run 2 was made after reading run 1 and is not an independent test · raw runs in eval/

The track’s five safety questions

Question	As Prescribed
Incorrect or unsupported responses	A line no transcript span supports is a proposal, shown to the therapist only.
Sensitive information	Synthetic data only, no free-text input in the demo; in a clinic, everything stays on its own hardware.
Uncertain results	Uncertain translations and the falsifier’s remaining objections are shown, never hidden.
High-risk decisions	A documented restriction halts the program; the therapist decides.
Human review	Nothing reaches the patient without the therapist’s approval.

What is next

Speech in

The visit itself as input, not a typed transcript.

More languages

And a native speaker’s review of every fixed text in each.

A stronger falsifier

The model-only errors are the gap: a larger model, or several judges.

A new sealed evaluation

New sessions, a new plan sealed before the first run.

Next stop: Since AI Turku, 6–8 November 2026.

As Prescribed

The prescription, verified line by line, on the clinic’s own AMD Radeon cards.

Demo: asprescribed.sunrisesoftware.app

Code: github.com/Sunrisesoftware-app/as-prescribed (MIT)

Every person and session in the demo is synthetic. Built by Sunrisesoftware for the AMD Developer Hackathon ACT III.
